Top 10 Frequently Asked Questions About Verséa

What is Verséa?

Verséa is a brand of clinically driven, broad-spectrum, hemp-derived CBD products that are only available through healthcare professionals. These highly concentrated formulations are wrapped in multiple layers of technology designed to enhance the potential for therapeutic effect.

What is CBD?

CBD, short for cannabidiol, is the primary cannabinoid found in Verséa products, and one of over 100 naturally occurring cannabinoids found in the cannabis plant. CBD is the dominant cannabinoid in industrial hemp, which U.S. law defines as cannabis having 0.3% or less delta-9-tetrahydrocannabinol (THC) content by dry weight.

What is the Endocannabinoid System (ECS)?

CBD is believed to produce its therapeutic effect by interacting with the ECS: a network of enzymes, receptor sites, and cannabinoids (produced by the body), that is responsible for maintaining balance across various body functions: memory, digestion, motor function, immune response, inflammation, appetite, and pain.

Where is Verséa hemp grown?

The hemp used in Verséa is organic, non-GMO, and grown in the USA.

How is Verséa manufactured?

Verséa is made using proprietary and trade-secreted, all-natural processes and following FDA's Good Manufacturing Practices and USDA guidelines from seed to sale.

What is broad-spectrum distillate?

Broad-spectrum distillate is a type of CBD that starts out as a full-spectrum (whole plant) extract and goes through an additional process to remove trace amounts of THC.

What is the "Entourage Effect"?

Entourage effect is used to describe what happens when multiple compounds from the industrial hemp plant work together. Though the impact of this effect has not yet been validated through clinical studies, this synergistic interaction is believed to increase the potential for therapeutic effect.

How can nanotechnology help?

Nanotechnology is used in the production of Verséa, and commonly used to increase the amount of a therapeutic substance that actually gets used by the body. The process is designed to shrink the size of a substance's particles to a nanometer or less. To give you an idea of how small that is, a human hair is about 60,000 – 100,000 nanometers wide.

How can a water-based formula help?

When a therapeutic substance that likes to be transported in fat needs to be taken orally, making it so the substance can be transported in water can enhance the amount that actually gets used by the body.

Will I fail a drug test if I use Verséa?

Different labs tend to have different testing protocols, so if this is of major concern, we recommend that you visit our website at www.versea.com, download the Certificate of Analysis (COA) for the appropriate Verséa product, then share it with the lab that administers your drug test to get an answer you can trust.

Disclaimer: Verséa products are not intended to diagnose, treat, cure or prevent any disease.
